## AudioSimplified

## **Phantom Power Supply**

## +48v from +15v power supply pcb for console rebuilders/diy

Often needed to add phantom power to consoles or preamps where it is not available, this low noise supply utilizes a switching regulator to boost the voltage and an analog regulator to then smooth out the ripple and silence the noise. The board is capable of driving 25 mic channels at full load (all channels were shorted to ground - 14ma  $\times$ 

25ch = 350ma). The input current graph shows the draw from your +15v supply, ensure that there is enough spare capacity.

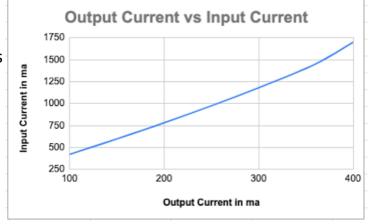

## **Specifications**

Input Voltage: 12vdc-24vdc

Output Voltage: 48vdc Output Current: 350ma Output Noise+Ripple: 25mv

**Size:**  $80mm \times 50mm (3.25" \times 2")$ 

Price: \$35.00
